The most important thing in conserving resources, I think, is to promote awareness on the wastefulness of our modern life even further.

We hear a lot about energy saving, preservation of forests and so on, but we still have unnecessary packaging, direct mails that no one reads and millions of plastic bottles thrown away every day, just to name a few. Awareness may be there but it's far from being enough.

One thing we could do to improve this situation will be to introduce lessons concerning resource conservation into our educational system – lessons where young people acquire insights into the issue, discuss it and develop views on how things have gone wrong in our modern life and how we could change the way things are now.

Promoting awareness may not be anything new but if we are determined to do something about resource conservation in the long term, full awareness of it is the most fundamental of all.
