V

If I had not chosen to go to medical school, I might have pursued a career in computer science or artificial intelligence. The ever-evolving technological development has always fascinated me and the possibility of creating innovative solutions through programming and AI development intrigues me. I have also loved since childhood to use my abilities to help others, and I think I would have strived to help solve the problems many people are facing with artificial intelligence, such as food insecurity and global warming. Although distinct from medicine, this path would have allowed me to explore new frontiers and shape the digital future in a meaningful way.
